

Recruitment Field for Researcher

No.	Theme	Number of Hires
101	Measurement, Analysis and Simulation Technologies for FDNPS Decommissioning	4
102	Safety Research on Risk Assessment for Nuclear Installations	4
103	Development of new technology to realize Nuclear x Renewable	3
104	Research on Deuterium Enrichment Technology	1
105	Advanced materials characterization and synchrotron-based measurement techniques for nuclear decommissioning	1
106	Research on Fabrication, Management, Storage, and Enhancement of Target Vessels for the J-PARC Spallation Neutron Source	1
107	Research and Development of MOX Fuel Fabrication Technology and Backend Technologies for the Realization of the Nuclear Fuel Cycle	2
108	R&Ds on applied laser technologies for decommissioning	2
109	Research on Nuclear Characteristics Analysis of Research Reactors	1
110	Fundamental R&D of Geological Disposal Technologies for High-level Radioactive Waste	5
111	Research and development for the realization on fast reactor cycle systems	5
112	Development of 'High-temperature gas-cooled reactor' capable of supplying large scale, domestic, carbon-free hydrogen	4
113	Research on the evaluation of irradiation and environmental effects on material properties	1
114	Research on the Long-Term Degradation of Materials and the Development of Materials for Enhancing the Safety of Nuclear Systems	1
115	Fundamental Research toward the Practical Application of Advanced Technology Fuels	1
116	Chemical research in nuclear engineering	1
117	Development of Advanced Radiation Measurement Technologies and Their Applications	1
118	Research on the PHITS development aimed at application in the field of nuclear engineering	1
119	Research on thermal-hydraulic design of innovative nuclear energy systems	1

※For details on each theme, please see the following sections.

Recruitment Field for Researcher

101 (1) Theme and Contents	Measurement, Analysis and Simulation Technologies for FDNPS Decommissioning
	<p>You will contribute to building the scientific foundation that supports the decommissioning of the Fukushima Daiichi Nuclear Power Station (FDNPS). For this purpose, you will be conducting comprehensive measurements and analyses of fuel debris, structures, waste, and the environment, and using simulations to clarify the various phenomena that occur within these processes. The work spans three interconnected areas:</p> <p>(1) Characterization and behavior analysis of fuel debris, structural materials, and solid waste; (2) Dust behavior analysis in work environments and treatment processes; (3) Advanced analysis, inspection and simulation technologies for remote and autonomous operations.</p> <p>You will combine a wide range of expertise, including physics, chemistry, measurement/analysis, materials, and simulation, to conduct research and development of technologies that can be implemented at the Fukushima Daiichi Nuclear Power Plant site and in the decommissioning process.</p>
(2) The ideal type of human resources being sought	<p>We welcome applicants with strengths in any of the following: physical chemistry, radiochemistry, measurement technologies, chemical analysis, fine particle and powder mechanics, material properties, imaging, or computational modeling. Candidates should be comfortable working across disciplinary boundaries and collaborating with diverse teams. A positive attitude toward field tests and research activities connected directly to real decommissioning operations is highly expected.</p>
(3) The attraction of our department	<p>This role provides a rare opportunity to conduct research directly linked to one of the world's most challenging and socially significant engineering projects. You will work with leading universities, research institutes, and industry partners in Japan and abroad. The position offers an excellent environment for developing broad and internationally relevant expertise. Research outcomes can have immediate practical impact on operational safety and efficiency at Fukushima Daiichi, enabling you to experience real-world implementation of your work.</p>
(4) Branches of knowledge related to this theme	<p>(Major Category) Energy Engineering (Subcategory) Nuclear engineering</p> <hr/> <p>(Major Category) Nanotechnology/Materials (Subcategory) Metallic material properties</p> <hr/> <p>(Major Category) Manufacturing Technology (Subcategory) Control and system engineering</p> <hr/> <p>(Major Category) Informatics (Subcategory) Robotics and intelligent system, Software</p>
(5) Place of employment (tentative)	Fukushima (Tomioka town), Ibaraki (Tokai village)
(6) Qualification Requirements	Having a master or a doctor degree / To be expected to complete a master's or a doctor's course in March 2027
(7) Contact person about the theme	<p>(Name) Yukihiisa SANADA</p> <p>(Department) Collaborative Laboratories for Advanced Decommissioning Science</p> <p>(Position) Group Leader</p> <p>(E-mail) jaea-jinji2027@jaea.go.jp</p>

Recruitment Field for Researcher

102 (1) Theme and Contents	Safety Research on Risk Assessment for Nuclear Installations												
	<p>Nuclear Safety Research Center conducts multifaceted and comprehensive research on nuclear facilities such as light water reactors and nuclear fuel reprocessing plants. This research includes understanding thermal-hydraulic phenomena during accidents, evaluating the integrity of fuel and structural materials, safety assessment during accidents at nuclear fuel cycle facilities, and providing technical support for IAEA safeguards activities. Considering current situation, our research focuses on long-term operation, promotion of risk-informed applications, environmental safety associated with decommissioning, and optimization of measures nuclear or radiological emergencies.</p>												
(2) The ideal type of human resources being sought	Persons who are motivated by scientific interests on nuclear safety research field.												
(3) The attraction of our department	<p>Nuclear Safety Research Center aims to be trusted by society by developing human resources of specialists who are able to respond to the social needs such as nuclear safety and nuclear emergency preparedness.</p> <p>The center offers a wide range of research opportunities, such as activities using large experimental facilities, conducting elemental experiments, developing codes, etc. Every researcher in the center enjoys the freedom to utilize his/her own personality and strengths in the wide variety of research fields. The center encourages researchers to be autonomous, allows them to propose and expand research even early in their careers. In addition, through joint researches with utility companies, manufacturers and/or foreign organizations, they will be able to tackle issues in the worldwide nuclear industry and to gain knowledge by studying in foreign research institutes or universities.</p>

Recruitment Field for Researcher

103 (1) Theme and Contents	Development of new technology to realize Nuclear x Renewable								
	<p>We pursue the vision of “Nuclear × Renewable,” aiming for unprecedented utilization of nuclear energy and conducting research and development with a view toward social implementation in renewable energy, space, medicine, and industry. Specifically, our R&D focuses on three pillars: the development of large-scale energy storage systems using uranium (renewable energy), the development of RI heat sources for semi-permanent batteries (space), and the recycling of radioactive waste into resources (medicine and industry). In addition, we oversee these three R&D projects, engaging in management tasks such as progress monitoring, stakeholder identification, and coordination.</p>								
(2) The ideal type of human resources being sought	<p>The candidate must be willing and able to work on research and technological development regardless of his/her field of study. Experience and enthusiasm for research and development focused on experimental work are particularly desirable. Additionally, candidates who are motivated to take on roles in project management, technical sales, and technology transfer in the future are also preferred.</p>								
(3) The attraction of our department	<p>In order to realize our vision of “Nuclear x Renewable”, we will develop cutting-edge technologies that represent our organization to open the way to the future of nuclear energy.</p>

Recruitment Field for Researcher

104 (1) Theme and Contents **Research on Deuterium Enrichment Technology**

Our group aims to develop technologies that enable the low-cost, large-scale production of deuterium, an isotope of hydrogen, using electrochemical devices. Deuterium (D), which is present only in trace amounts in natural water, is an important substance used in semiconductors, OLEDs, optical fibers, pharmaceutical development, and as a potential fuel for future fusion energy. However, almost all deuterium used in Japan is currently imported, which poses serious challenges in terms of price volatility and supply risk. In our group, we are working to establish domestically produced deuterium technologies that are both low-cost and suitable for mass production, using polymer electrolyte membrane (PEM)-based electrochemical devices. We conduct integrated research and development from fundamental studies to applied research with an eye toward practical implementation. The main duties include:

- Development of innovative water electrolysis technologies that enable simultaneous production of hydrogen and deuterium, contributing to carbon-neutral energy systems
- Design and evaluation of efficient deuterium enrichment processes using water electrolysis technologies
- Design and development of electrode catalysts optimized for efficient deuterium enrichment
- Characterization of the physical and electrochemical properties of developed catalysts and electrolysis cells, and elucidation of the mechanisms of deuterium enrichment

(2) The ideal type of human resources being sought

We do not require any specific expertise or knowledge level at the time of joining.

We welcome highly motivated individuals who are interested in research and development in either applied or fundamental science (or both), who are curious about research in general beyond this specific theme, who would like to tackle their own original topics and make an impact, who are eager to take on new challenges, who are interested in carbon neutrality, the SDGs, and energy issues, or who wish to contribute to Japanese industry.

Questions and lab visits are always welcome, so please feel free to contact us.

(3) The attraction of our department

The distinctive feature of our lab is that we integrate knowledge and technologies from various fields, such as chemistry, physics, and engineering. This environment allows you to acquire a wide range of skills, from fundamental science to practical applications in areas such as material separation and energy conversion. For example, you can gain experience in carbon-neutral technologies such as water electrolysis and fuel cells, in the design and mechanistic analysis of catalyst materials that support these technologies, and in surface analysis techniques that are essential for understanding reaction mechanisms. These are all part of the latest scientific knowledge and technology.

Furthermore, we place strong emphasis on your career development through the above-mentioned activities. You don't need to worry if you lack specialized knowledge when you join. The lab leader has extensive teaching experience at the university level and has supervised many master's and doctoral students, providing careful guidance and support tailored to each individual's pace. We offer practical support ranging from basic skills, such as scientific writing and presentation techniques, to mentoring for conference presentations and paper writing, depending on your needs.

If you are interested in research, we would be delighted to have you join us in shaping the future together.

Recruitment Field for Researcher

105 (1) Theme and Contents	Advanced materials characterization and synchrotron-based measurement techniques for nuclear decommissioning
	<p>To support the safe and steady decommissioning of the Fukushima Daiichi Nuclear Power Station, it is essential to precisely characterize the property changes of materials such as fuel debris, structural components, and concrete that experienced extreme conditions. Using high-precision structural and chemical-state analyses at large synchrotron radiation facility (SPring-8) and other facilities, this research seeks to clarify the long-term stability and reaction mechanisms of these materials and provide scientific insights for future waste treatment and disposal strategies. The project also advances synchrotron analytical techniques and develops new measurement methods to enhance long-term safety assessment.</p>
(2) The ideal type of human resources being sought	<p>Candidates with an interest in materials science or synchrotron-based measurement techniques, and with a motivation to contribute to the societal mission of nuclear decommissioning, are encouraged to apply. No specific academic background is required. Curiosity, creativity, and a flexible, forward-looking approach to developing new technologies are highly valued.</p>
(3) The attraction of our department	<p>This research provides opportunities to investigate a wide range of materials relevant to decommissioning using state-of-the-art synchrotron-based analytical techniques. The outcomes contribute directly to improving the safety and long-term planning of decommissioning activities, supporting a national project from scientific and technical perspectives. The work also involves advancing measurement methodologies, enabling professional growth in both materials science and photon-based analytical technologies.</p>
(4) Branches of knowledge related to this theme	<p>(Major Category) Nanotechnology/Materials (Subcategory) Structural materials and functional materials</p> <p>(Major Category) Energy Engineering (Subcategory) Nuclear engineering, Quantum beam science</p>
(5) Place of employment (tentative)	Hyogo(Sayo Town)
(6) Qualification Requirements	Having a master or a doctor degree / To be expected to complete a master's or a doctor's course in March 2027
(7) Contact person about the theme	<p>(Name) Dr. Masaaki KOBATA</p> <p>(Department) Synchrotron Radiation Research Group, Materials Sciences Research Center, Nuclear Science Research Institute</p> <p>(Position) Assistant Principal Engineer</p> <p>(E-mail) jaea-jinji2027@jaea.go.jp</p>

Recruitment Field for Researcher

106 (1) Theme and Contents	Research on Fabrication, Management, Storage, and Enhancement of Target Vessels for the J-PARC Spallation Neutron Source
	<p>The Spallation Neutron Source at J-PARC provides world-class pulsed neutron beams using a proton beam accelerated by a high-intensity proton accelerator. It supplies these beams to neutron instruments, contributing to cutting-edge research across broad fields of materials science and life sciences. This theme involves research activities related to the fabrication of replacement devices, such as mercury target vessels, management during operation including mercury circulation systems, storage of this devices, and enhancement efforts such as extending operation life and improving durability. Specifically, you will engage in one or more of the following: ordering the manufacture of target vessels and other devices; performing structural and flow analysis related to manufacturing and enhancement; conducting related maintenance; managing equipment upkeep, device disposal, operation, and troubleshooting; planning replacements and managing operations; while simultaneously conducting research and development on target vessels with extended lifetime and high durability.</p>
(2) The ideal type of human resources being sought	<p>This spallation neutron source requires expertise in radiation-related knowledge and consists of diverse equipment. Beyond specialized knowledge of the target equipment, familiarity with other systems is essential. We seek individuals with a spirit of self-directed inquiry, a proactive desire to incorporate new knowledge, and the ability to approach their duties with seriousness and enthusiasm.</p>
(3) The attraction of our department	<p>Due to its unique nature, this spallation neutron source involves significant international collaboration, offering numerous opportunities for global engagement. Beyond specialized expertise, it provides frequent exposure to knowledge across diverse fields. We actively support the acquisition of necessary qualifications and skills required for the job.</p>
(4) Branches of knowledge related to this theme	<p>(Major Category) Nanotechnology/Materials (Subcategory) Metallic material properties</p> <hr/> <p>(Major Category) Energy Engineering (Subcategory) Nuclear engineering</p> <hr/> <p>(Major Category) Manufacturing Technology (Subcategory) Mechanics of materials and materials, Fluid engineering, Thermal engineering</p>
(5) Place of employment (tentative)	Ibaraki (Tokai village)
(6) Qualification Requirements	Having a master or a doctor degree / To be expected to complete a master's or a doctor's course in March 2027
(7) Contact person about the theme	<p>(Name) Masahide HARADA</p> <p>(Department) Neutron Source Section, Materials and Life Science Division, J-PARC Center</p> <p>(Position) Section Leader</p> <p>(E-mail) jaea-jinji2027@jaea.go.jp</p>

Recruitment Field for Researcher

107 (1) Theme and Contents	Research and Development of MOX Fuel Fabrication Technology and Backend Technologies for the Realization of the Nuclear Fuel Cycle		
	<p>JAEA's vision is "Exploring the Future through Nuclear and Renewable Synergy." We focus on R&D to enhance nuclear energy sustainability through the nuclear fuel cycle—processing used nuclear fuel for reuse in power plants. Our research excludes reactor technology, concentrating on fuel fabrication and back-end areas such as reprocessing and waste treatment. We also design, upgrade, and maintain essential R&D equipment through hands-on work, creating valuable results and innovations..</p>		
	<p>The specific research areas are as follows:</p> <ul style="list-style-type: none"> ○ MOX Fuel Fabrication R&Ds to establish oxide fuel fabrication technology for fast reactors, including characterization of oxide powder materials and development of new fabrication methods. ○ Reprocessing Equipment for Fast Reactor Cycle R&Ds to improve and develop fuel reprocessing advanced equipments for practical application with considerations for safety and remote operability. ○ Treatment of Low-Level Radioactive Waste R&Ds to establish treatment technologies for low-level waste, including stabilization and solidification, evaluation of hydrogen gas behavior in TRU waste, and technologies contributing to Fukushima decommissioning process. 		
(2) The ideal type of human resources being sought	<p>Individuals who are passionate and motivated to take on challenging research themes, capable of identifying engineering issues and working proactively to solve them. Those who can deliver results through conducting experiments and developing or improving equipment. People who can communicate effectively with domestic and international researchers and diverse specialists, and collaborate to address challenges.</p>		
(3) The attraction of our department	<p>In R&D on fast reactor fuel, we carry out projects based on the government's "Strategic Roadmap" for the fast reactor demonstration. Fast reactors are an important technology that contributes to energy self-sufficiency and the reduction of radioactive waste. Establishing a stable fuel fabrication technology is research and development directly linked to solving national challenges. In addition, developing equipment for practical implementation of advanced reprocessing technology is a globally challenging theme, led by JAEA. Large-scale research to develop engineering equipment and demonstrate effectiveness through testing is a unique and rewarding aspect of working at a national research institute. Furthermore, R&D on radioactive waste treatment technologies involves collaboration with domestic and international organizations, tackling a wide range of themes directly linked to solving critical issues—making this work highly rewarding. Moreover, we are exploring the application of generative AI and robotics, providing an environment where flexible and innovative thinking can thrive. Our workplace is vibrant, with many young researchers and active participation from women and international staff. Beyond writing papers, you will have the opportunity to engage in hands-on experiments, another attractive feature of this position.</p>		
(4) Branches of knowledge related to this theme	(Major Category)	Manufacturing Technology	(Subcategory) Mechanics of materials and materials, Control and system engineering, Design engineering
	(Major Category)	Environmental science	(Subcategory) Environmental load reduction and remediation, Environmental materials and recycle technology

Recruitment Field for Researcher

108 (1) Theme and Contents

R&Ds on applied laser technologies for decommissioning

Our main mission is the research and development of laser processing technologies that can be applied to the decommissioning of nuclear reactor facilities, such as laser cutting and laser decontamination. In addition to experiments, we also develop numerical analysis techniques for laser processing, and by combining experiments and analysis, we understand the various phenomena that occur during laser irradiation and conduct research to decide appropriate laser irradiation conditions for various laser processing for metals and other materials.

On the other hand, laser processing is a technology widely used in many kinds of industrial fields, and in order to enable the technology developed at our institute to be used in various fields, we are conducting research into its application not only to the cutting and decontamination mentioned above, but also to heat treatment, rust removal and rust prevention treatment, welding and joining technology, etc.

The ideal candidate is expected to have the following qualifications:-

(2) The ideal type of human resources being sought

- * Regardless of the major studied at universities or other research institutes, applicants must have the motivation and enthusiasm to work on new research and development and the application of technologies.
- * Willingness to actively acquire knowledge and skills.
- * Willingness to tackle difficult challenges.
- * Excellent communication skills to work cooperatively with colleagues.

(3) The attraction of our department

- * Lasers have a high energy density and enable high-precision non-contact processing. In addition, depending on the wavelength, they can be transmitted through optical fiber, making them suitable for remote processing technology, and they are expected to be used in a variety of industrial fields. For the time being, we aim to continue contributing to the achievement of the SDGs by not limiting our research to laser cutting and laser decontamination for the decommissioning of nuclear facilities, but by encouraging young researchers to take on new challenges with their own free ideas.
- * It is important that the results of our research and development be widely utilized in industry and be useful to society. We actively make our research results public through presentations at academic societies both in Japan and overseas and through the submission of papers. We also actively pursue joint research not only with other departments within the organization, but also with companies, research institutes, universities, and other organizations.

(4) Branches of knowledge related to this theme

Recruitment Field for Researcher

109 (1) Theme and Contents

Research on Nuclear Characteristics Analysis of Research Reactors

The New Research Reactor Promotion Office is advancing a project to construct a new research reactor for neutron applications at the Monju site. To achieve a world-class level of stable thermal neutron flux, highly skilled personnel are required not only to perform analytical tasks—such as neutron transport, criticality, burnup, and shielding calculations—but also to contribute to the R&D of advanced computational methods and tools.

As existing computational codes have become legacy systems and the number of developers continues to decline, there is a growing need for personnel who can bridge research and design/operations divisions while driving the development of next-generation computational codes that incorporate modern analytical methodologies. These roles are essential for supporting reactor safety assessments and advancing reactor design.

(2) The ideal type of human resources being sought

* Personnel who recognize their role in supporting the foundation of nuclear technology and who have the resilience to advance research and development by bridging research and technical divisions.

* Personnel with broad technical knowledge spanning electrical and mechanical engineering, materials science, physics, chemistry, and nuclear engineering.

* Personnel with curiosity and a strong desire for growth, who are willing to take on new challenges in developing advanced technologies.

(3) The attraction of our department

As the number of neutron research facilities decreases in Japan, this project marks Japan's first new research reactor in about 30 years. It is expected to strengthen national technological capabilities and has drawn strong expectations from academia, industry, and the local community. Opportunities to take part in constructing a new reactor are extremely rare. Join us in advancing this project and realizing a reactor that will contribute broadly to society.

(4) Branches of knowledge related to this theme

(Major Category) Energy Engineering (Subcategory) Nuclear engineering

(Major Category) Manufacturing Technology (Subcategory) Fluid engineering, Measurement engineering

(Major Category) Informatics (Subcategory) Software, Computational science, High performance computing

(5) Place of employment (tentative)

Ibaraki (Tokai village)*

*Due to the progress of the project, the primary business location may be relocated to Fukui Prefecture (Tsuruga City) in the future.

(6) Qualification Requirements

Having a master or a doctor degree / To be expected to complete a master's or a doctor's course in March 2027

Recruitment Field for Researcher

110 (1) Theme and Contents	Fundamental R&D of Geological Disposal Technologies for High-level Radioactive Waste																												
	<p>Fundamental research to support the geological disposal program of high-level radioactive waste (HLW) in the following areas:</p> <ol style="list-style-type: none"> 1. Characterization of the geological environment (e.g. groundwater flow, groundwater chemistry, mass transport, groundwater chemistry, behavior of microorganisms, rock mechanics) 2. Studies on long-term stability of the geological environment (including development of dating techniques) 3. Repository engineering technologies 4. Long-term behavior of engineered barriers (metals, clay minerals, cementitious materials etc.) 5. Physicochemical behavior of radioactive nuclides, such as solubility, sorption etc. 6. Safety assessment technologies for geological disposal system. <p>Application of state-of-the-art technologies (e.g., digital twin technologies) to those area is recommended.</p>																												
(2) The ideal type of human resources being sought	<p>Researcher who has strong sense of mission to pursue the research on deep geological disposal of high-level radioactive waste. In order to enhance the reliability of geological disposal technology for high-level radioactive waste, we are looking for people with high motivations to take on the challenge of solving problems in various scientific and technological fields and with high activities toward a single goal in cooperation with others.</p>																												
(3) The attraction of our department	<p>Although the term "disposal" sometimes imagines negative, geological disposal is one of the important subjects due to the final process in nuclear fuel cycle. Various professional areas, e.g., geoscience, civil engineering, rock engineering, hydrology and solution chemistry, are required in R&D on geological disposal. Everyone who has any professional areas mainly in science and technology can play an active role. We look forward to your application!</p>

Recruitment Field for Researcher

111 (1) Theme and Contents	Research and development for the realization on fast reactor cycle systems																				
	<p>Our institute is engaged in research and development of fast reactor cycle systems for social implementation with the aim of realizing sustainable carbon neutrality.</p> <p>In the R&D of fast reactor cycle, JAEA utilizes its fast reactor cycle-related development infrastructure (reactor facilities, post-irradiation examination facilities, fuel fabrication facilities, reprocessing facilities, thermal-hydraulics test facilities, structure and material test facilities, etc.) to conduct: 1) experimental research on fast reactor safety measures, core, fuel and materials, equipment and systems, instrumentation, fuel fabrication and reprocessing, etc., and 2) development of fast reactor cycle analysis methods.</p> <p>You will be responsible for the following areas:</p> <ul style="list-style-type: none"> • Core design • Safety assessment, including severe accident analysis, sodium-water reaction evaluation, and source term analysis • Development of Integrated systems utilizing artificial intelligence (AI) and advanced simulations • In-core thermal hydraulics • High temperature structures and materials, including the establishment of codes and standards • Production of medical radioisotopes (RI) • Minor actinide(MA) fuel irradiation test 																				
(2) The ideal type of human resources being sought	<p>We are looking for persons who are aspiring and motivated to actively participate in our research activities for the sustainable energy system.</p> <p>Under this theme, knowledge and skills in nuclear engineering, mechanical engineering, etc. will be the base, but any major from your student days is acceptable.</p>																				
(3) The attraction of our department	<p>The fast reactor cycle is an innovative system that makes the most efficient use of uranium and supplies energy for us for thousands of years as a domestic technology. It also significantly reduces the toxicity of radioactive waste so that it can solve the spent fuel issue from nuclear power plants in operation today. Our experimental fast reactor Joyo is planned to resume soon, and the Japanese government's Strategic Roadmap clarifies a wide range of research activities to come for the start of a demonstration reactor around 2050. We, therefore, need passionate and creative youths to work with as a team.</p>

Recruitment Field for Researcher

112 (1) Theme and Contents	Development of 'High-temperature gas-cooled reactor' capable of supplying large scale, domestic, carbon-free hydrogen												
	Significant reductions in CO ₂ emissions from industrial sectors such as iron and steel and chemicals are required to achieve carbon neutrality. To realise the societal implementation of high temperature gas-cooled reactor (HTGR), we will tackle the following challenges. This technology enables the domestic production of the massive quantities of carbon-free hydrogen needed to decarbonise these high-emission industries:												
	<ul style="list-style-type: none"> (1) The world's first demonstration of hydrogen production using HTGR (2) Advancing reactor design technologies using the test reactor "HTTR" (3) Enhancing the performance of 'ceramic-coated particle fuel' for HTGR (4) Development of carbon free hydrogen production technologies using high temperature heat 												
(2) The ideal type of human resources being sought	Individuals with the collaborative skills and flexibility to drive the HTGR hydrogen demonstration project, working effectively with domestic and international stakeholders. Individuals who think independently, take initiative and proactively pursue their goals.												
(3) The attraction of our department	Our project enables participants to acquire experience and knowledge in a wide range of technologies, including experiments, numerical simulations, design, component manufacturing, and demonstration tests in a wide variety of fields such as fuels and materials, thermal fluid, reactor physics, instrumentation and control, chemical engineering, etc., through the HTGR development. In addition, we provide an environment for international activities through collaboration with overseas organizations such as the UK National Nuclear Laboratory and participation in projects of international organizations such as the IAEA.												
(4) Branches of knowledge related to this theme	<table border="0"> <tr> <td>(Major Category)</td> <td>Energy Engineering</td> <td>(Subcategory)</td> <td>Nuclear engineering, Earth resource engineering, Energy sciences</td> </tr> <tr> <td>(Major Category)</td> <td>Manufacturing Technology</td> <td>(Subcategory)</td> <td>Design engineering, Mechanics of materials and materials, Chemical reaction and process system engineering, Fluid engineering, Thermal engineering</td> </tr> <tr> <td>(Major Category)</td> <td>Social Infrastructure</td> <td>(Subcategory)</td> <td>Safety engineering</td> </tr> </table>	(Major Category)	Energy Engineering	(Subcategory)	Nuclear engineering, Earth resource engineering, Energy sciences	(Major Category)	Manufacturing Technology	(Subcategory)	Design engineering, Mechanics of materials and materials, Chemical reaction and process system engineering, Fluid engineering, Thermal engineering	(Major Category)	Social Infrastructure	(Subcategory)	Safety engineering

Recruitment Field for Researcher

113 (1) Theme and Contents	Research on the evaluation of irradiation and environmental effects on material properties.		
	<p>Research activities will focus on new cladding tubes and various component materials used in accident-tolerant fuel for light water reactors, small modular reactors . The aim is to elucidate the effects of irradiation under in-reactor conditions on material properties, while also considering the development of new materials optimized for material behavior. By evaluating the correlation between the microstructures and mechanical properties of materials irradiated under various environmental conditions, as well as irradiation damage behavior and changes in material–environment compatibility, we will investigate the combined effects of irradiation and environmental factors (irradiation, thermal loads, stress, atmosphere, etc.). Incorporating advanced information technologies such as AI, we will promote fundamental and foundational research and development that contributes to lifetime prediction and feasibility assessments necessary for equipment design..</p>		
(2) The ideal type of human resources being sought	<p>We seek individuals who have experimental research experience in optimizing material properties and controlling microstructures of metallic or inorganic materials, who understand the roles and objectives of materials in nuclear systems as their application domain, and who can proactively and independently advance research activities. Such individuals should be capable of identifying specific needs and challenges on their own, collaborating with internal and external partners, and leveraging their knowledge and experience in materials science. Experience in irradiation experiments using facilities such as experimental reactors or accelerators, as well as proficiency in English conversation essential for international collaboration, is desirable.</p>		
(3) The attraction of our department	<p>It offers the opportunity to engage in materials research that supports new nuclear systems, whose importance will continue to grow in the future. The research environment allows for in-depth exploration of fundamental material properties aimed at developing superior materials. With modeling specialists within the group, it is possible to incorporate computational science approaches in addition to experimental research, thereby broadening skills and expertise in materials research. Furthermore, opportunities are available to present at international conferences abroad and to conduct research at collaborating institutions overseas.</p>		
(4) Branches of knowledge related to this theme	(Major Category)	Nanotechnology/Materials	(Subcategory) Structural materials and functional materials, Material processing and microstructure control, Composite materials and interfaces, Metallic material properties
(5) Place of employment (tentative)	Ibaraki (Tokai village)		
(6) Qualification Requirements	Having a doctor degree / To be expected to complete a doctor's course in March 2027		
(7) Contact person about the theme	(Name)	Nariaki Okubo	
(7) Contact person about the theme	(Department)	Nuclear Science and Engineering Center, Research Group for Radiation Materials Engineering	
(7) Contact person about the theme	(Position)	Group Leader	
(7) Contact person about the theme	(E-mail)	jaea-jinji2027@jaea.go.jp

Recruitment Field for Researcher

114 (1) Theme and Contents	<p>Research on the Long-Term Degradation of Materials and the Development of Materials for Enhancing the Safety of Nuclear Systems</p>
	<p>Our group conducts research to improve the safety and reliability of nuclear systems. We focus on understanding corrosion and degradation mechanisms in nuclear materials and developing advanced corrosion-resistant alloys. This work supports key challenges such as Fukushima Daiichi decommissioning, aging management of light-water reactors, and integrity assessment of spent fuel reprocessing equipment.</p> <p>We combine unique experimental capabilities—such as corrosion testing under radiation environments—with advanced computational approaches, including first-principles calculations and predictive modeling. Joining us offers the opportunity to gain expertise in materials science and simulation while contributing to solutions for global energy challenges.</p>
(2) The ideal type of human resources being sought	<p>We welcome individuals who are passionate about contributing to research aimed at enhancing the safety of nuclear systems. We seek those who, while considering societal needs, are willing to actively engage in experiments and simulations and wish to apply their knowledge and experience in materials development and corrosion engineering. In particular, because our work focuses on materials used in nuclear systems, we welcome candidates who are motivated to acquire knowledge and techniques related to the corrosion of stainless steels widely used as structural and component materials, and who are eager not only to pursue fundamental research but also to contribute to the social implementation of research outcomes.</p>
(3) The attraction of our department	<p>Our group is one of Japan's leading teams in nuclear materials corrosion research. We offer unique facilities for experiments such as corrosion testing under radiation environments and access to one of Japan's largest supercomputers for advanced simulations. In a collaborative and supportive atmosphere, we encourage young researchers to grow while tackling impactful challenges in nuclear safety.</p>
(4) Branches of knowledge related to this theme	<p>(Major Category) Nanotechnology/Materials (Subcategory) Composite materials and interfaces</p>
(5) Place of employment (tentative)	<p>Ibaraki (Tokai village)</p>
(6) Qualification Requirements	<p>Having a doctor degree / To be expected to complete a doctor's course in March 2027</p>

Recruitment Field for Researcher

115 (1) Theme and Contents Fundamental Research toward the Practical Application of Advanced Technology Fuels

We are engaged in fundamental research to address the technical challenges involved in the practical deployment of Advanced Technology Fuel (ATF). Specifically, we are advancing the sophistication of evaluation techniques for fission product (FP) gas release behavior up to high burnup, which is one of the key issues in ATF enhancement.

By conducting fuel irradiation tests in Japan's research reactor JRR-3, ion irradiation experiments using a tandem accelerator, FP gas release tests from irradiated fuels, and microstructural observations, we aim to elucidate the fundamental mechanisms governing fuel behavior. Based on these findings, we will improve the physical models incorporated in fuel behavior analysis codes.

In addition to the above, this work contributes to Japan's next-generation fuel development by promoting research and development on critical issues in ATF advancement through a combination of experimental and analytical approaches.

(2) The ideal type of human resources being sought •Master's degree or higher
 •Research experience in nuclear fuel or materials science, with strong motivation to engage in both experimental and analytical work
 •Enthusiasm for pioneering new technologies and driving research forward

(3) The attraction of our department •Opportunity to participate in a flagship national project that leads Japan's all-Japan effort in ATF development
 •Abundant opportunities to work globally, including international conferences and collaborative research
 •Access to advanced experimental facilities and a well-equipped research environment that fosters professional growth as a researcher

Recruitment Field for Researcher

116 (1) Theme and Contents **Chemical research in nuclear engineering**

Our research group conducts studies on chemical reactions and develops analytical technologies related to nuclear fuel reprocessing and radioactive waste disposal. In this research field, we focus on solvent extraction technologies used for nuclear fuel reprocessing and radionuclide separation, the immobilization of radioactive species into waste forms, and the effects of radiation on these processes, as well as the behavior of radionuclides after disposal. We aim to establish fundamental data and build mathematical models for these chemical phenomena. In addition, we develop advanced spectroscopic methods and automated analytical technologies based on mass spectrometry as common foundational tools for these research activities.

(2) The ideal type of human resources being sought

We are seeking individuals with a strong background in chemistry related to the nuclear field, who are motivated to identify research challenges independently and carry out innovative studies. Expertise in one or more of the following areas is desirable: separation engineering, radiation chemistry, physical chemistry, inorganic chemistry, spectroscopy, analytical chemistry, or computational chemistry. However, we also welcome candidates from different disciplines who are eager to tackle issues in nuclear engineering.

(3) The attraction of our department

The field of nuclear waste treatment and disposal still faces many critical challenges that must be addressed to ensure nuclear energy remains a sustainable option for future energy supply. Our group offers an opportunity to apply your expertise and capabilities to research and development in a socially significant area. If you aspire to grow as a researcher and contribute to society through impactful scientific achievements, we encourage you to apply.

Recruitment Field for Researcher

117 (1) Theme and Contents	Development of Advanced Radiation Measurement Technologies and Their Applications																
	<p>We are engaged in the research and development of radiation measurement technologies essential for nondestructive analysis of nuclear fuel materials and radioactive substances, characterization of radiopharmaceuticals, radiation field assessment for boron neutron capture therapy, and measurements of radiation originating from thunderclouds. The successful candidate will undertake a research topic selected in consideration of their interests and aptitudes.</p>																
	<p>The appointed researcher will conduct experimental studies using facilities such as the J-PARC MLF and the tandem accelerator facility, complemented by Monte Carlo simulations. Through these activities, the researcher will contribute to the development of novel radiation detection techniques and their scientific and technological applications.</p>																
(2) The ideal type of human resources being sought	<p>We welcome candidates who are highly motivated to engage in research and development. The research group comprises members with diverse academic backgrounds, and no specific field of study is required. All essential knowledge and technical skills will be provided through structured on-the-job training and instruction following appointment.</p>																
(3) The attraction of our department	<p>In addition to developing nondestructive analysis technologies essential to the nuclear field, the appointed researcher will engage in socially and academically significant research across medicine and the natural sciences. The researcher will also conduct cutting-edge studies using advanced facilities and will have opportunities to launch new research themes and collaborate with external institutions, through which they can further advance their own research program.</p>

Recruitment Field for Researcher

118 (1) Theme and Contents Research on the PHITS development aimed at application in the field of nuclear engineering

We will enhance the capabilities for analyzing low-energy neutron behavior and performing activation calculations, expanding PHITS functionality to broaden its application in nuclear engineering. Furthermore, utilizing these enhanced capabilities, we will conduct research applying PHITS to diverse fields such as reactor decommissioning and the design of medical radioisotope production facilities.

(2) The ideal type of human resources being sought

PHITS is widely applied not only in radiation facility design, medical physics, and space-related research, but also in the field of nuclear engineering, including decommissioning measures. Therefore, we seek students who are proficient in both nuclear engineering and radiation science, can meet the application needs of PHITS in the nuclear field, and can actively advance its applied research themselves. Furthermore, since PHITS is used in approximately 80 countries worldwide and over half of its users live overseas, strong English communication skills are desirable.

(3) The attraction of our department

The research group for radiation transport analysis comprises researchers proficient in diverse fields including nuclear reaction models, atomic physics, condensed matter physics, and radiation biology, providing an optimal environment for expanding research scope through interdisciplinary collaboration. Furthermore, with a proven track record of hosting PHITS workshops not only in Europe and the Americas but also across Asia, Africa, the Middle East, and South America, members can experience diverse cultures through on-site workshops and seminars, enabling them to expand their professional horizons globally.

Recruitment Field for Researcher

119 (1) Theme and Contents Research on thermal-hydraulic design of innovative nuclear energy systems

The Nuclear Engineering Research Center conducts research and development on innovative nuclear systems to build a decarbonized society. These innovative nuclear systems include new reactor types that can coexist with renewable energy and space reactors, which exemplify the diversification of nuclear energy applications. This project involves developing thermal-hydraulic calculation and experimental methods for these new nuclear systems, as well as developing multiphysics simulation technologies, including the integration of thermal-hydraulic calculations with neutronics calculations.

(2) The ideal type of human resources being sought

We are seeking candidates who can work independently on thermal-hydraulic research related to nuclear reactors. It is also desirable for candidates to have a mindset that seeks to understand the needs of regulatory authorities and industry, and to give back the results to society. For this theme, specialized knowledge in thermal-hydraulics is essential.

(3) The attraction of our department

The nuclear reactor design and core analysis methodology research are essential in the development of innovative nuclear energy systems. Through this theme, we will contribute to the realization of carbon neutrality by 2050. Young researchers are encouraged to be proactive and have the freedom to utilize their own individuality and strengths in research and development. They can also participate in joint research with universities and research institutions. Global research activities are also possible through study abroad at foreign institutions and participation in international conferences and meetings at international organizations. We encourage the external presentation of research results and actively make research results available to the public.

(4) Branches of knowledge related to this theme

(Major Category) Energy Engineering (Subcategory) Nuclear engineering
